

Unit 9 Part 3: Ideal Gas Law

Ideal Gas Law

- P = pressure (variable units)
- V = volume (MUST be in L)
- n = quantity (MUST be in mol)
- R = universal gas constant (variable units)
- T = temperature (MUST be in K, of course)

Universal Gas Constant, R

- Value depends on the units for pressure!
- Values are given on the formula chart!
- R relates the energy scale in physics to the temperature scale: super important!

Gas Constant, R, Values

$$\begin{aligned}
 &= 0.08206 \text{ L atm mol}^{-1}\text{K}^{-1} \\
 &= 62.36 \text{ L mmHg mol}^{-1}\text{K}^{-1} \\
 &= 62.36 \text{ L torr mol}^{-1}\text{K}^{-1} \\
 &= 8.314 \text{ L kPa mol}^{-1}\text{K}^{-1} \\
 &= 0.08206 \text{ L atm mol}^{-1}\text{K}^{-1}
 \end{aligned}$$

$$\frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}$$

A on formula chart!

→ PV = nRT
for when you have only one of each variable

* → GAS CONSTANT MUST MATCH ALL THE UNITS!!!!!! ← *

Examples:

1. What is the pressure in atmospheres exerted by a 0.500 mol sample of nitrogen gas in a 10.0 L container at 298 K?

$$\begin{aligned}
 P &= ? \text{ atm} \quad \text{so } R = 0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}} \\
 n &= 0.500 \text{ mol} \\
 V &= 10.0 \text{ L} \\
 T &= 298 \text{ K}
 \end{aligned}$$

$$\begin{aligned}
 PV &= nRT \\
 P(10.0 \text{ L}) &= (0.500 \text{ mol}) \left(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}} \right) (298 \text{ K}) \\
 \frac{P(10.0 \text{ L})}{10.0 \text{ L}} &= \frac{(0.500 \text{ mol}) (0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}) (298 \text{ K})}{10.0 \text{ L}}
 \end{aligned}$$

$$P = 1.22 \text{ atm}$$

2. What is the volume, in liters, of 8.00 g of oxygen gas at 20.0°C and 740.24 mmHg pressure?

$$\begin{aligned}
 \frac{8.00 \text{ g O}_2}{32 \text{ g O}_2} &= \frac{1 \text{ mol O}_2}{32 \text{ g O}_2} \\
 n &= 0.250 \text{ mol O}_2
 \end{aligned}$$

$$\begin{aligned}
 PV &= nRT \\
 (740.24 \text{ mmHg})(V) &= (0.250 \text{ mol}) \left(62.36 \frac{\text{L} \cdot \text{mmHg}}{\text{mol} \cdot \text{K}} \right) (293 \text{ K}) \\
 \frac{(740.24 \text{ mmHg})(V)}{740.24 \text{ mmHg}} &= \frac{(0.250 \text{ mol}) (62.36 \frac{\text{L} \cdot \text{mmHg}}{\text{mol} \cdot \text{K}}) (293 \text{ K})}{740.24 \text{ mmHg}}
 \end{aligned}$$

$$V = 6.17 \text{ L}$$

3. What mass of chlorine gas, Cl₂, in grams, is contained in a 10.0 L tank at 27.0°C and 3.50 atm of pressure?

$$\begin{aligned}
 (3.50 \text{ atm})(10.0 \text{ L}) &= n \left(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}} \right) (300.0 \text{ K}) \\
 \frac{(3.50 \text{ atm})(10.0 \text{ L})}{(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}) (300.0 \text{ K})} &= \frac{n (0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}) (300.0 \text{ K})}{(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}}) (300.0 \text{ K})}
 \end{aligned}$$

$$\begin{aligned}
 n &= 1.42 \text{ mol Cl}_2 \quad | \quad 70.90 \text{ g Cl}_2 \\
 & \quad \quad \quad | \quad 1 \text{ mol Cl}_2
 \end{aligned}$$

$$= 101 \text{ g Cl}_2$$

→ PV=nRT can also be used to describe relationships between pressure, volume, number of moles, and temperature! ←

Inversely related if on same side.
Directly related if on opposite sides.

Examples:

4. If we decrease the volume of a gaseous system by a factor of 3, what will happen to the pressure of the system (if all other variables remain constant)?

$$PV = nRT$$

same side, so
inversely related

if V decreases by a factor of 3,
 P will increase by a factor of 3 (triple)

5. If we increase the temperature of a gaseous system by a factor of 2, what will happen to the volume of the system (if all other variables remain constant)?

$$PV = nRT$$

opposite sides, so directly related

if T increases by a factor of 2,
 V increases by a factor of 2 (doubles)

6. If we lower the temperature of a gaseous system by a factor of 4 and increase the volume by a factor of 2, what will happen to the pressure of the system (if all other variables remain constant)?

$$T \div 4 \text{ means } P \text{ will decrease to } \frac{1}{4}$$

$$V \times 2 \text{ means } P \text{ will decrease to } \frac{1}{2}$$

$$\frac{1}{4} \times \frac{1}{2} = \frac{1}{8}$$

P decreases by a
factor of 8, to
 $\frac{1}{8}$ the original

Practice Makes Perfect!

1. What pressure, in torr, is exerted by 0.325 mol of hydrogen gas in a 4.08 L container at 35.0°C?

$$P(4.08L) = (0.325 \text{ mol}) \left(62.36 \frac{\text{L} \cdot \text{torr}}{\text{mol} \cdot \text{K}} \right) (308.0 \text{ K})$$

$$P = 1530 \text{ torr}$$

2. If we increase the temperature of a gaseous system by a factor of 2 and increase the volume by a factor of 4, what will happen to the pressure of the system (if all other variables remain constant)?

$T \times 2$ means P will increase $\times 2$

$V \times 4$ means P will decrease to $\frac{1}{4}$

$$2 \times \frac{1}{4} = \frac{1}{2}$$

P decreases by
a factor of 2, to
 $\frac{1}{2}$ the original

3. What is the mass, in grams, of oxygen gas in a 12.5 L container at 45.0°C and 731.39 kPa?

$$(731.39 \text{ kPa})(12.5L) = n \left(8.314 \frac{\text{L} \cdot \text{kPa}}{\text{mol} \cdot \text{K}} \right) (318.0 \text{ K})$$

$$n = 3.46 \text{ mol } O_2 \left| \begin{array}{l} 32 \text{ g } O_2 \\ 1 \text{ mol } O_2 \end{array} \right. = 111 \text{ g } O_2$$
